

The work, told as it actually happened.

Five constructed case studies for Sefat Hossain — WordPress security, Elementor, Shopify, and performance. Draft narratives for review, refinement, and sign-off before copy and build.

STAGE

Case Study Construction

STATUS

Draft v1 · for sign-off

These are drafts built to be corrected — not fiction to be admired.

Three of your five signature projects are **invisible services**. Nobody can screenshot malware you removed or an attack you prevented. So those projects only work as *stories* — a business in trouble, a calm intervention, a recovered outcome. That reconstruction is the single most valuable thing on your future site, and it's what will make it read like a premium studio build rather than a template.

Every narrative below is written from your stated skills and your own voice: calm, honest, detail-oriented, no exaggeration. But **nothing here is invented as fact**. Wherever a real number, client name, or live URL belongs, you'll see an **orange placeholder**. Those are yours to fill or replace. Where you have no number, we keep the qualitative outcome and never manufacture one — that honesty is on-brand for a security specialist, and it's a hard rule of this build.

01 Read each story for truth, not polish.

If a detail is wrong or overstated, mark it. Understating is safer than overstating — especially in security.

02 Fill the orange placeholders.

Real symptoms, real outcomes, real before/after numbers where they exist. Each case ends with a short "what I need from you" list.

03 Two live URLs unlock everything visual.

The Elementor build and the Shopify store are your only *showable* work. One live link or screenshot set each turns them from claims into proof.

Bringing a Hacked Business Website Back From the Brink

Complete WordPress Malware Removal & Website Recovery

THE SITUATION

A business owner reached out in the worst possible state: their WordPress website — the front door to their business — had been compromised. **[Describe the symptom: e.g. Google was showing a red "this site may be harmful" warning / visitors were being redirected to spam / the site was defaced / traffic had collapsed overnight]**. Customers couldn't trust what they were seeing, and every hour the site stayed compromised was doing quiet damage to a reputation that took years to build.

By the time most owners find me, they've already tried the obvious things and made it worse. They're not looking for someone to panic with them. They're looking for someone calm who has seen this before.

HOW I APPROACHED IT

Recovering a hacked site is methodical work, not guesswork. Rushing it is how you miss the backdoor that lets the attacker walk straight back in a week later. My process:

- Isolated the site and took a full forensic snapshot before touching anything, so nothing was lost and the damage could be understood.
- Ran a complete malware scan across core files, themes, plugins, and the database to map every piece of malicious code — not just the obvious symptom.
- Identified the entry point — the outdated plugin, weak credential, or vulnerability the attacker actually used — because cleaning without finding the door is temporary.
- Removed all malware, injected code, and hidden backdoors, then replaced compromised core files with clean versions.
- Submitted the site for review to lift any Google blacklist or "deceptive site" warning and restore its standing in search.
- Hardened the essentials before handing it back, so recovery didn't just return the site to the same vulnerable state it started in.

THE OUTCOME

[e.g. <48h]

Time to clean & restore

[Delisted]

Google blacklist removed

[100%]

Malware & backdoors cleared

The site was returned clean, delisted, and back online — but more importantly, the owner got their peace of mind back. **[Optional: a sentence on what recovery meant for them — reopened storefront, restored bookings, regained trust]**. That's the part that matters. A website isn't just files; for the person who owns it, it's their livelihood.

WHAT I NEED FROM YOU TO MAKE THIS REAL

- › What kind of business was it, and what was the visible symptom of the hack?
- › Roughly how fast did you turn it around? (a range is fine — "under two days")
- › Was there a Google blacklist / warning that you got removed?
- › Anything the client said afterward you can quote (even paraphrased) — testimonial slot.

Turning an Exposed Business Site Into a Locked Front Door

WordPress Security Hardening for Business Websites

THE SITUATION

A business came to me with a site that *looked* fine — it loaded, it worked, it made sales. What they didn't see was how exposed it was underneath: **[name the real gaps you found: outdated plugins, no firewall, weak admin logins, no backups, no SSL, default settings left in place]**. Nothing had gone wrong yet. That's exactly the moment most people ignore security — and exactly the moment it's cheapest to fix.

My belief drives this kind of work: launching a website is the beginning, not the finish line. A site that isn't protected isn't finished — it's just waiting.

HOW I APPROACHED IT

I don't bolt on a security plugin and call it done. Hardening is a layered process, each layer closing a door an attacker would otherwise use:

- Audited the full attack surface — logins, user roles, plugins, themes, file permissions, and server configuration — to find what was actually exploitable.
- Locked down access with strong authentication, brute-force protection, and limited login attempts, since credentials are the most common way in.
- Installed and configured a proper firewall / web application firewall to filter malicious traffic before it reaches the site.
- Brought the whole stack current — core, themes, and plugins — and removed the unused, abandoned ones that quietly become vulnerabilities.
- Set up automated backups and scheduled malware scanning, so if anything ever does happen, recovery is a button, not a crisis.
- Documented what was done in plain language, so the owner understands their own site instead of depending on blind trust.

THE OUTCOME

The site went from silently exposed to actively protected and monitored — firewalled, backed up, updated, and watched. The owner stopped worrying about the thing they didn't previously know to worry about.

[Optional: if this became an ongoing maintenance arrangement, say so — it's the strongest possible proof of the long-term relationship you want].

This is the work that never makes the news, because when it's done right, nothing happens. That's the whole point.

WHAT I NEED FROM YOU TO MAKE THIS REAL

- › Which specific vulnerabilities did you actually find and close? (real examples make this land)
- › Did this turn into an ongoing maintenance / retainer relationship? — this is the exact business model the site is built to attract.
- › Any tools you rely on (Wordfence, Sucuri, iThemes, etc.) you're happy to name.

A Premium Business Website That Earns Its First Impression

Premium Elementor Business Website Development

THE SITUATION

A business **[industry / client name if shareable]** needed a website that matched the quality of what they actually offer. What they had — or what they'd been quoted elsewhere — was the usual: a generic template that looks like a thousand others and quietly tells visitors "this is a small operation." For a business trying to win serious clients, that first impression is a cost.

HOW I APPROACHED IT

- Started with the business goal, not the design — who the site needs to convince, and what action it needs to drive.
- Designed and built in Elementor for a clean, premium, fully custom look — no cookie-cutter template, structured so the client can actually update it themselves later.
- Built performance in from the start: optimized assets, clean structure, and fast load times, rather than treating speed as an afterthought.
- Made it genuinely responsive across phone, tablet, and desktop — designed mobile-first, since that's where most visitors actually arrive.
- Laid an SEO-ready foundation — proper structure, headings, and metadata — so the site could be found, not just admired.
- Handed over with a walkthrough, so the client owns their site instead of being locked into needing a developer for every small change.

THE OUTCOME

[URL]

Live site — link to embed

[90+]

PageSpeed score (if measured)

[Fully responsive]

Across all devices

The result was a website the business could stand behind — premium, fast, easy to manage, and built to grow with them. **[Optional outcome: any change in enquiries, bounce rate, or how the client described the difference]**.

WHAT I NEED FROM YOU TO MAKE THIS REAL — HIGHEST PRIORITY

- › **The live URL, or a set of screenshots.** This is your only visible "look what I built" proof. Without it, this stays a claim instead of a showcase.
- › The industry / type of business (client name only if you're allowed to share it).
- › Any measured result — PageSpeed, load time, or client feedback.

A Shopify Store Built to Sell, Not Just to Exist

Shopify Store Design & Customization

THE SITUATION

An online store owner **[niche / product type]** needed more than a default Shopify theme switched on. They needed a store that reflected their brand, made products easy to find, and gave shoppers a clear, trustworthy path to checkout — the difference between a store that gets visitors and one that gets orders.

HOW I APPROACHED IT

- Set up and customized the Shopify theme to match the brand, rather than leaving it looking like every other store on the same template.
- Structured products, collections, and navigation so customers find what they want in as few steps as possible.
- Designed the storefront and product pages around conversion — clear imagery, obvious calls to action, and a checkout flow with no friction.
- Configured the essentials properly: payments, shipping rules, and the right apps for the store's actual needs, without bloating it with plugins it doesn't use.
- Optimized for speed and mobile, because a slow store on a phone is a lost sale.
- Handed over a store the owner can run day to day — adding products and managing orders without needing a developer on call.

THE OUTCOME

[URL]

Live store — link to embed

[Custom]

Fully branded storefront

[Mobile-ready]

Optimized checkout flow

The owner launched with a store that looked professional, worked smoothly, and was theirs to manage.

[Optional: any result — sales, conversion, or the owner's own words about the launch] .

WHAT I NEED FROM YOU TO MAKE THIS REAL — HIGHEST PRIORITY

- › **The live store URL, or screenshots.** Same as the Elementor build — this is showable proof, and it's the point.
- › What the store sells, and anything you customized beyond the theme (apps, custom sections, integrations).
- › Any post-launch result the owner shared.

Making a Slow Website Fast Enough to Keep Its Visitors

Website Performance Optimization

THE SITUATION

A website was quietly losing people before they ever saw it — **[the real problem: pages took [X] seconds to load / failing Core Web Vitals / high bounce rate / slow on mobile]**. Speed isn't a vanity metric. A slow site frustrates visitors, gets ranked lower by Google, and turns paid traffic into wasted spend. The owner could feel the problem even before they could measure it.

HOW I APPROACHED IT

- Ran a full performance audit against Core Web Vitals to find what was actually slowing things down, instead of guessing.
- Compressed and correctly sized images — usually the single biggest cause of a heavy page — and enabled modern formats and lazy loading.
- Set up proper caching and minified the CSS and JavaScript, so browsers do less work on every visit.
- Cleaned up the database and removed the plugin bloat that accumulates on most sites over time.
- Added a CDN where it made sense, so the site loads quickly regardless of where the visitor is.
- Re-tested and tuned until the numbers held up on both desktop and mobile — not just on the developer's fast connection.

THE OUTCOME

[34 → 92]

PageSpeed before → after

[X.Xs → X.Xs]

Load time reduction

[Passed]

Core Web Vitals

The site went from sluggish to genuinely fast — better for visitors, better for search ranking, and better for every marketing dollar pointed at it.

[If you have real before/after scores, this case study becomes the most persuasive one on the whole site — numbers sell performance work like nothing else].

WHAT I NEED FROM YOU TO MAKE THIS REAL

- › Any real before/after numbers at all — PageSpeed scores, GTmetrix grades, load times. Even one pair is powerful.
- › If you have no saved numbers, a qualitative version still works ("cut load time roughly in half") — we never invent a figure.
- › The type of site it was (WooCommerce, business site, blog) for context.

Fill these in, and the case-study pages write themselves.

You don't need to write anything polished — just give me the raw truth for each line below and I'll shape it into the same voice you see above. The two live URLs are the only things demo content genuinely can't stand in for, so those come first.

CASE 03 **Live URL or screenshots** of the Elementor business site — top priority, it's your visible proof.

CASE 04 **Live URL or screenshots** of the Shopify store — same reason.

CASE 01 The hack symptom, your turnaround time, and whether you lifted a Google blacklist.

CASE 02 The real vulnerabilities you closed, and whether it became ongoing maintenance.

CASE 05 Any before/after performance numbers you can find — even one pair.

ALL FIVE Any client quote or review you can share for the testimonial slots — even a short Upwork/
Fiverr line.
